## E-LEARNING IN THE TRUCK INDUSTRY

E-learning is especially useful for trucking companies that have drivers who are on the road for long periods of time and are unable to attend traditional in-person training sessions. E-learning can be used to provide drivers with a wide range of training, including safety training, compliance training, and even training on the latest technologies used in the trucking industry. This type of training can be delivered through online courses, webinars, and virtual classrooms, which allows drivers to complete the training at their own pace and on their own schedule.

Moreover, e-learning can also help trucking companies to keep track of the training of their drivers, as well as to ensure compliance with industry regulations. It can also help reduce costs associated with traditional training methods, such as travel and accommodation expenses.

In conclusion, e-learning is a valuable tool for the trucking industry, as it allows drivers to receive training at their convenience, regardless of their location. It can provide training on a wide range of topics, including safety, compliance, and new technologies, and can also help trucking companies to keep track of their drivers' training and compliance.

The C95-Challenge project seeks to increase the use of e-learning by testing innovative training methodologies for bus and truck drivers based on mobile technologies for educational purposes, as well as games to increase user motivation and develop skills and business language.
